

Melanoma Detection

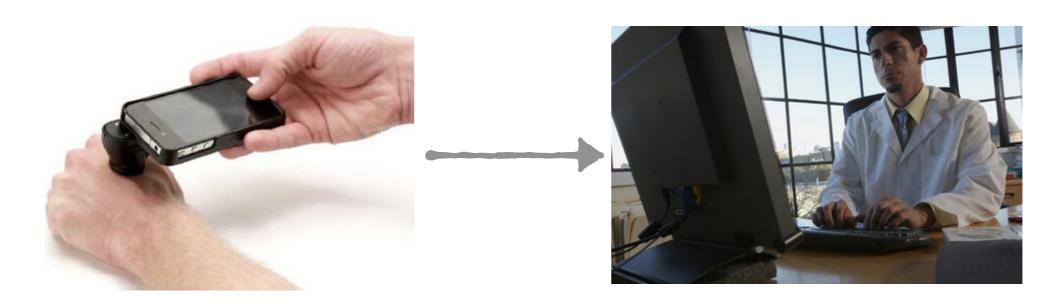

Rebecca Hyde

Melanoma Overview

- What is melanoma?
 - The most serious type of skin cancer
 - Appears suddenly on the skin or develops from an existing mole
 - Early detection is essential as advanced melanoma can spread to other parts of the body and lead to death
 - In 2016 it is estimated that there will be 76K new cases and 10K deaths in the US

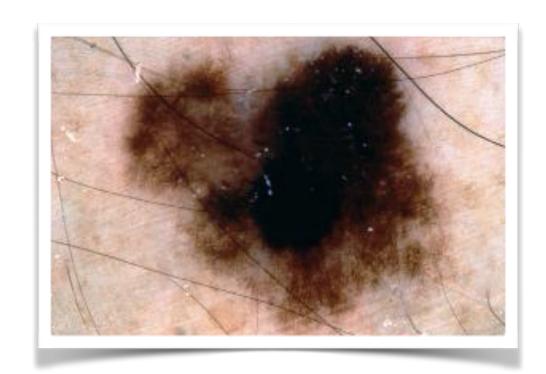

Detection

- Skin biopsy: only way to 100% confirm melanoma
- How does one know they need a skin biopsy?
- Today, we have teledermatology:

ABCDE Rule: Signs of Melanoma

- Asymmetry
- Border irregularity
- Color variations

- Diameter greater than 1/4 inch
- Evolving

Data & Model

- The data: International Skin Imaging Collaboration Archive*
 - 771 melanoma images/771 benign images of moles

 My model: convolution neural network (CNN) with 3 convolutional layers, 2 dense layers

^{*} International Skin Imaging Collaboration Archive: (https://isic-archive.com)

Actual

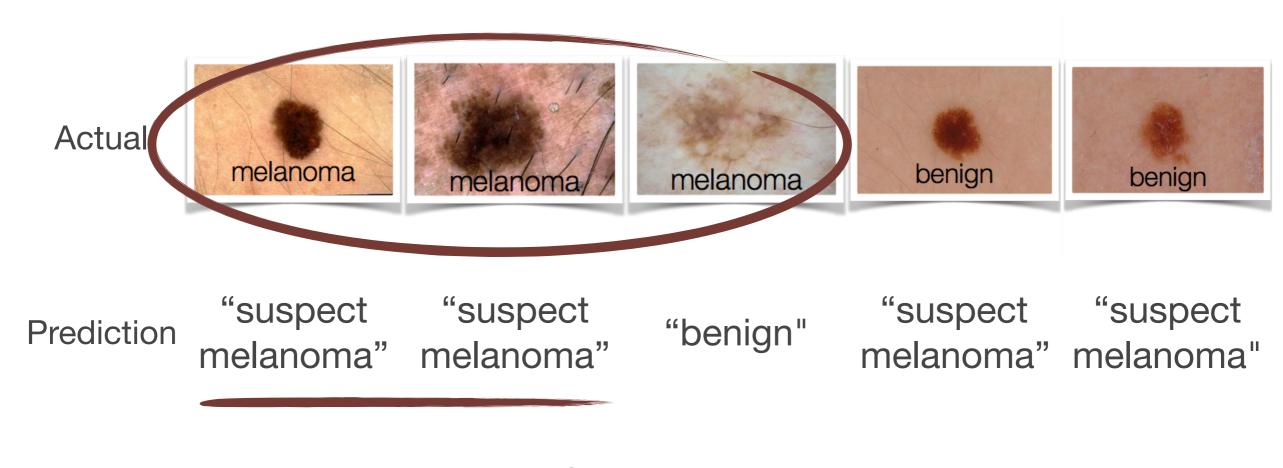

Prediction

"suspect

"suspect melanoma" melanoma"

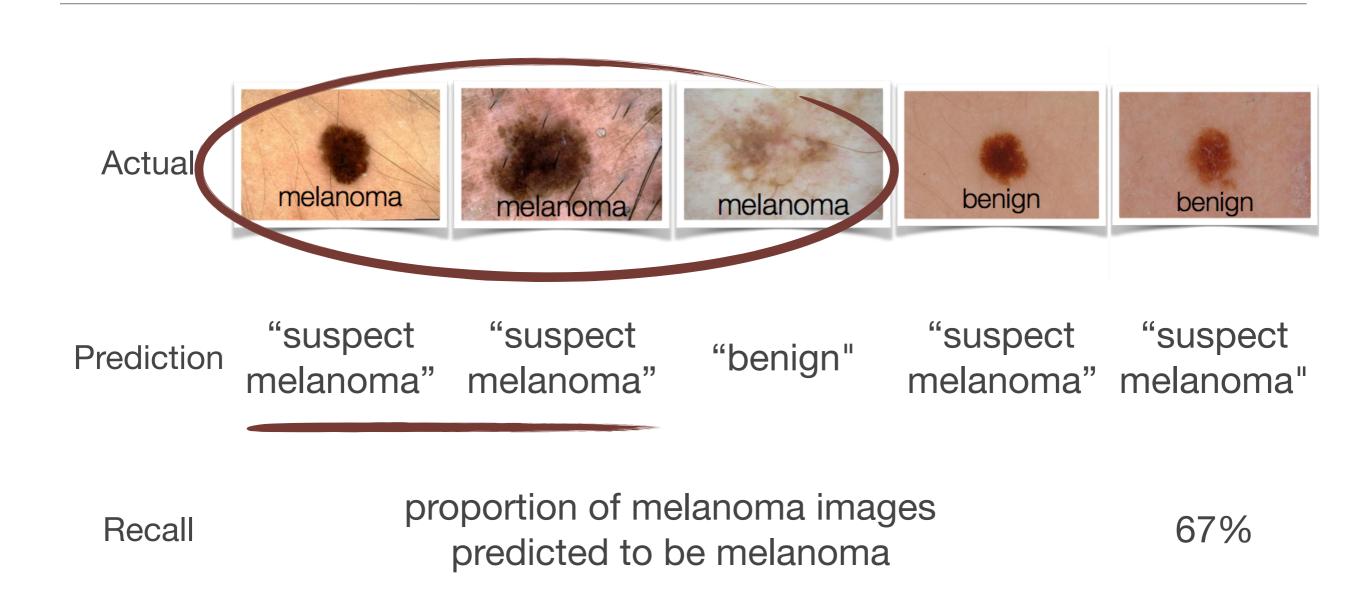

"benign"

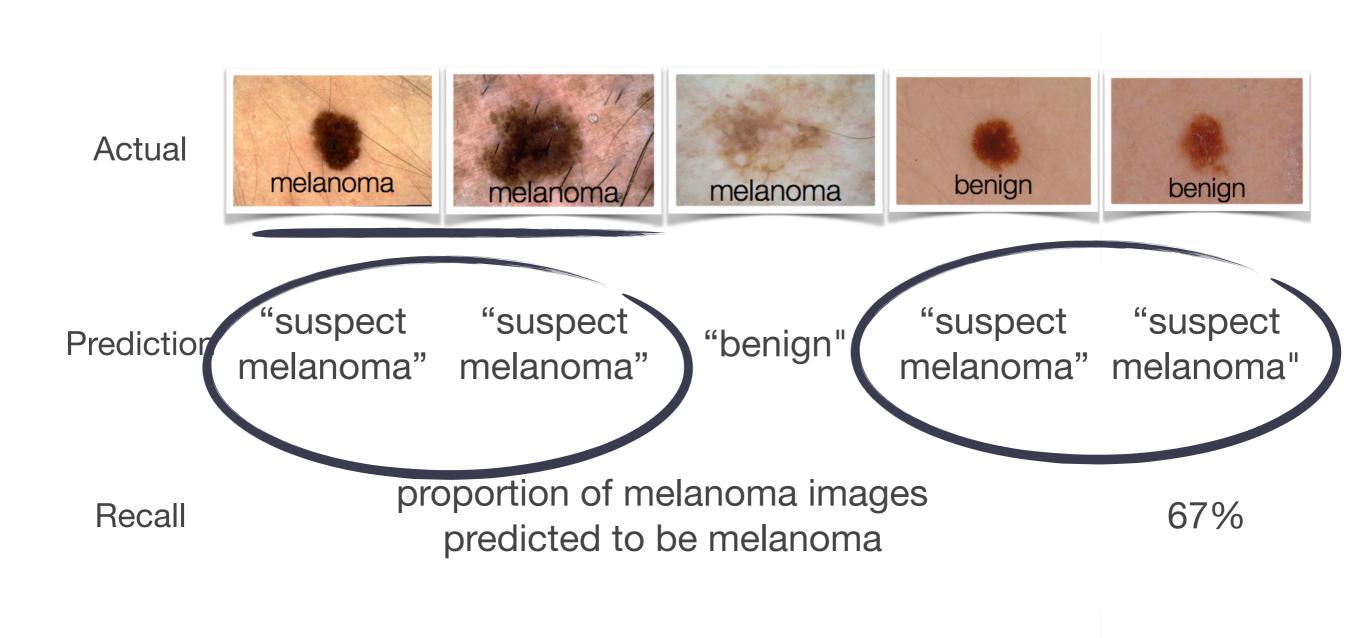

"suspect "suspect melanoma" melanoma"

Recall

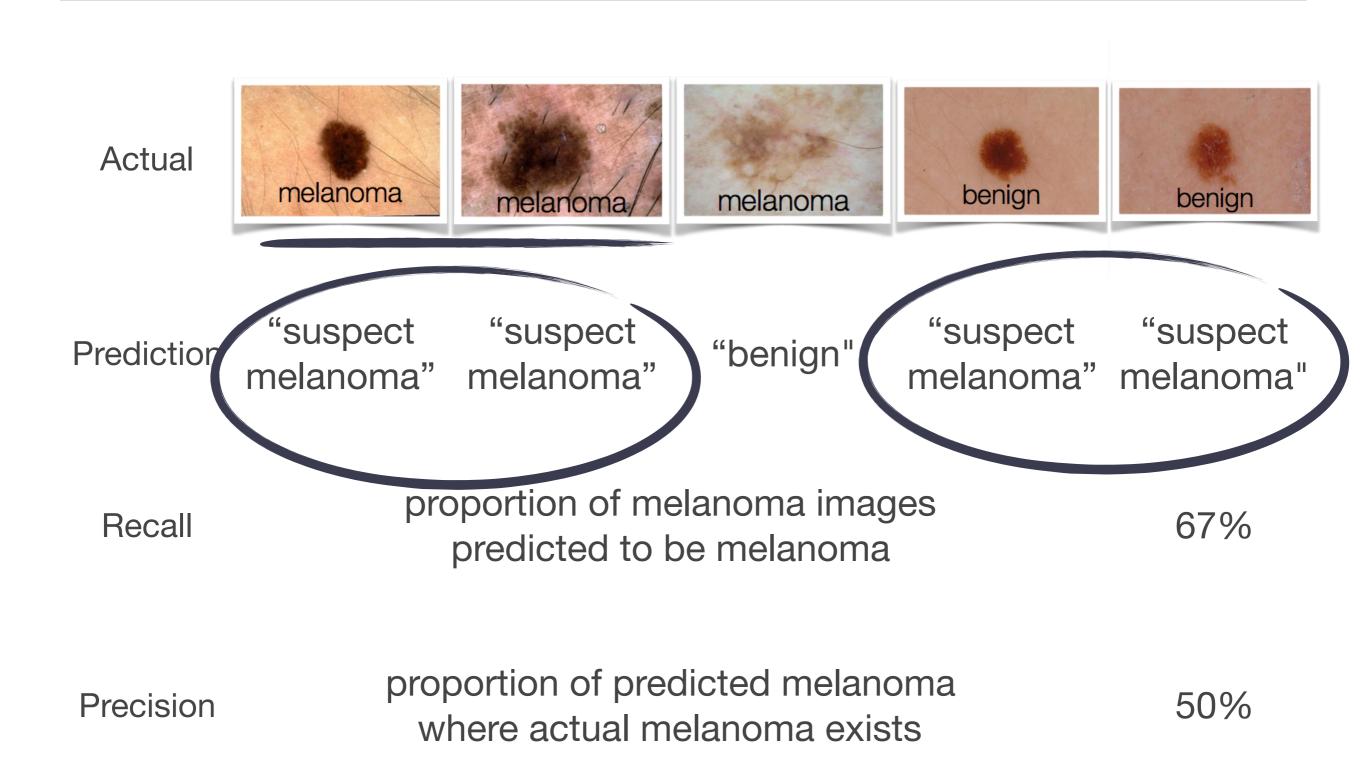

proportion of melanoma images predicted to be melanoma

Precision

proportion of predicted melanoma where actual melanoma exists

Teledermatologist Vs. Computer

	Teledermatologist Results
Recall	71%*
Precision	58%*

^{*} http://jamanetwork.com/journals/jamadermatology/fullarticle/419641

Teledermatologist Vs. Computer

	Teledermatologist Results	Full Color Images Test Set
Recall	71%*	79%
Precision 58%*		98%

^{*} http://jamanetwork.com/journals/jamadermatology/fullarticle/419641

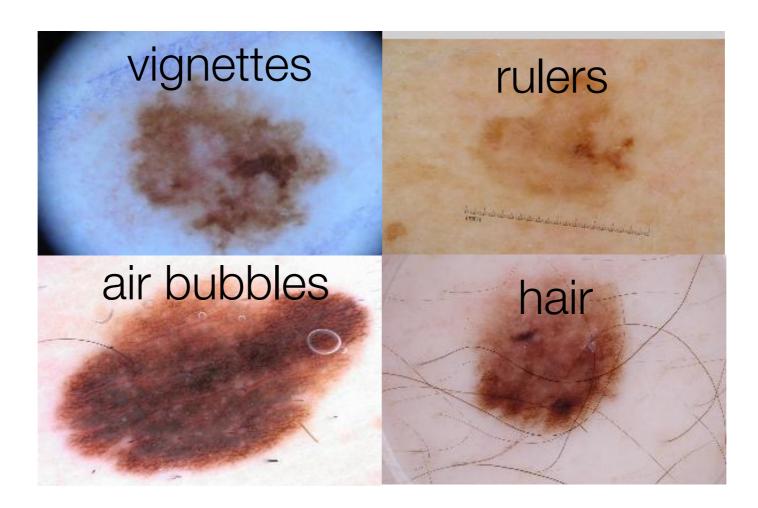

Teledermatologist Vs. Computer

	Teledermatologist Results	Full Color Images Test Set	Blue Channel Only Images Test Set
Recall	71%*	79%	96%
Precision	58%*	98%	66%

^{*} http://jamanetwork.com/journals/jamadermatology/fullarticle/419641

Next Steps

- Capture more melanoma images
- More complex model could improve results
- Remove artifacts in the pictures:

Thank You!
